Types of Nano-materials

By:

Dr. Mohammed Hashim Abbas

November 2021

Types of Nano-materials (Nano-size)

Nano-particles

A nanoparticle is a small particle that ranges between 1 to 100 nanometres in size. Most nanoparticles are made up of only a few hundred atoms.

Powder

Liquid

Nano-structures

A nanostructure is defined as any structure with one or more dimension, measuring in the nanometer scale range

0D

1D

2D

3D

Types of nano-structures

The nano-structures could be classified depending on the dimension and shape into:

0D

Quantum Dots

1D

One Dimensional

2D

Two Dimensional

3D

Three Dimensional

Quantum Dots (0D)

are tiny particles or nanocrystals with diameters in the range of 2-10 nanometers (10-50 atoms)

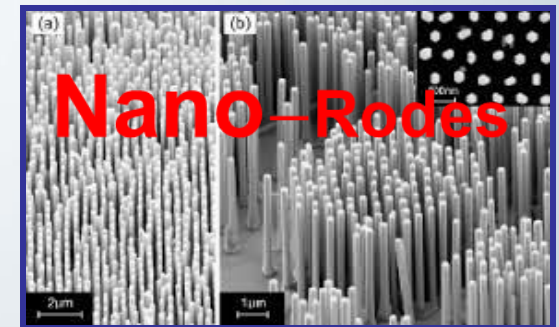

properties of 0D nanostructures

- 1- 0D diameters can range from about 2-10 nm.
- 2- 0D represent the smallest type of nano-structures.
- 3- 0D represents the best in properties compared to other types.
- 4- 0D can be found as nano-balls shaped.
- 5- 0D can used for various applications

One Dimensional Nanostructures (1D)

are those with a dimension within the range between 1 and 100 nm.

1D

properties of 1D nanostructures

- (a) 1D represent the highest surface-to-volume ratio
- (b) Electron confinement properties
- (c) Polar nature of the 1D nanostructure
- (d) 1D have larger useful for electron transport
- (e) 1D can be found as nano-rods, nano-needles, and nano-wires

Two Dimensional Nanostructures (2D)

are composed of thin layers that may have a thickness of at least one atomic layer.

2D

Nanoleaves

Nanoflags

Nanosheet

properties of 2D nanostructures

- 1- 2D represent single layer materials
- 2- 2D consisting of a single layer of atoms
- 3- 2D ease tuning of the molecular in the crystal.
- 4- Can be found as nano-leaves, nano-flags, and nano-sheet

Three Dimensional Nanostructures (3D)

are materials that are not confined to the nanoscale in any dimension. This class can contain dispersions of nanoparticles, bundles of nanowires.

3D

Such as; Nanocubes and Tetrapods

properties of tetrapods structure

1- Tetrapods appear four arms at 109.5° angle with each other

2- The sensors based on tetrapods can give multiple responses to a single signal at the same time

3- The tetrapods could be designed as multiterminal sensors for enhancing response

4- The junctions in the arms of tetrapods play a critical role in the electrical properties

Thank
