## Mathematical functions MATLAB :

offers many predefined mathematical functions for technical computing which contains a large set of mathematical functions. Typing help elfun and help specfun calls up full lists of elementary and special functions respectively. There is a long list of mathematical functions that are built into MATLAB. These functions are called built-ins. Many standard mathematical functions, such as $\sin (x), \cos (x), \tan (x), e x$, $\ln (\mathrm{x})$, are evaluated by the functions $\sin , \cos$, tan, exp, and log respectively in MATLAB. Table 2.1 lists some commonly used functions, where variables $x$ and $y$ can be numbers, vectors, or matrices. Table

## Elementary functions:

Table 2.1: Elementary functions

| $\cos (\mathrm{x})$ | Cosine | abs (x) | Absolute value |
| :---: | :---: | :---: | :---: |
| $\sin (\mathrm{x})$ | Sine | $\operatorname{sign}(\mathrm{x})$ | Signum function |
| $\tan (\mathrm{x})$ | Tangent | $\max (\mathrm{x})$ | Maximum value |
| $\operatorname{acos}(\mathrm{x})$ | Arc cosine | $\min (\mathrm{x})$ | Minimum value |
| $\operatorname{asin}(\mathrm{x})$ | Arc sine | ceil (x) | Round towards $+\infty$ |
| $\operatorname{atan}(\mathrm{x})$ | Arc tangent | floor (x) | Round towards $-\infty$ |
| $\exp (\mathrm{x})$ | Exponential | round (x) | Round to nearest integer |
| sqrt (x) | Square root | rem(x) | Remainder after division |
| $\log (\mathrm{x})$ | Natural logarithm | angle(x) | Phase angle |
| $\log 10$ ( x ) | Common logarithm | conj (x) | Complex conjugate |

In addition to the elementary functions, MATLAB includes a number of predefined
constant values. A list of the most common values is given in Table 2.2.

Table 2.2: Predefined constant values

| pi | The $\pi$ number, $\pi=3.14159 \ldots$ |
| :--- | :--- |
| $i, j$ | The imaginary unit $i, \sqrt{-1}$ |
| Inf | The infinity, $\infty$ |
| NaN | Not a number |

## Examples:

We illustrate here some typical examples which related to the elementary functions previously defined As a first example, the value of the expression
$y=e-a \sin (x)+10 \vee y$, for $a=5, x=2$, and $y=8$
is computed by
>> $a=5 ; x=2 ; y=8 ;$
$\gg y=\exp (-a)^{*} \sin (x)+10^{*} \operatorname{sqrt}(y)$
$y=$
28.2904

The subsequent examples are
>> $\log (142)$
Ans=
4.9558
>> $\log 10(142)$
Ans=
2.1523

Note the difference between the natural $\operatorname{logarithm} \log (x)$ and the decimal logarithm (base 10) $\log 10(x)$.

To calculate $\sin (\pi / 4)$ and e 10 , we enter the following commands in MATLAB
>> $\sin (\mathrm{pi} / 4)$
ans $=$
0.7071
>> $\exp (10)$
Ans=
$2.2026 \mathrm{e}+004$

## Notes:

- Only use built-in functions on the right hand side of an expression. Reassigning the value to a built-in function can create problems.
- There are some exceptions. For example, $i$ and $j$ are pre-assigned to $v-1$. However, one or both of $i$ or j are often used as loop indices.
- To avoid any possible confusion, it is suggested to use instead ii or jj as loop indices.

## Basic plotting

MATLAB has an excellent set of graphic tools. Plotting a given data set or the results of computation is possible with very few commands. You are highly encouraged to plot mathematical functions and results of analysis as often as possible. Trying to understand mathematical equations with graphics is an enjoyable and very efficient way of learning math ematics. Being able to plot mathematical functions and data freely is the most important step, and this section is written to assist you to do just that.

## Creating simple plots:

The basic MATLAB graphing procedure, for example in 2D, is to take a vector of $x$ coordinates, $x=(x 1, \ldots, x N)$, and a vector of $y$-coordinates, $y=(y 1, \ldots, y N)$, locate the points ( $x i, y i)$, with $i=1,2, \ldots, n$ and then join them by straight lines. You need to prepare $x$ and $y$ in an identical array form; namely, $x$ and $y$ are both row arrays or column arrays of the same length.

The MATLAB command to plot a graph is $\operatorname{plot}(\mathrm{x}, \mathrm{y})$. The vectors $\mathrm{x}=(1,2,3,4,5,6)$ and $\mathrm{y}=(3,-1,2,4,5$, 1) produce the picture shown in Figure
>> $x=\left[\begin{array}{llllll}1 & 2 & 3 & 4 & 5 & 6\end{array}\right]$;
$\gg y=\left[\begin{array}{lllll}3 & -1 & 2 & 4 & 5\end{array}\right.$ 1];
>> $\operatorname{plot}(x, y)$

## Note:

The plot functions has different forms depending on the input arguments. If y is a vector plot(y)produces a piecewise linear graph of the elements of $y$ versus the index of the elements of $y$. If we specify two vectors, as mentioned above, $\operatorname{plot}(\mathrm{x}, \mathrm{y})$ produces a graph of y versus x .

For example, to plot the function $\sin (x)$ on the interval $[0,2 \pi]$, we first create a vector of $x$ values ranging from 0 to $2 \pi$, then compute the sine of these values, and finally plot the result:

Figure 2.1: Plot for the vectors x and y

```
>> x = 0:pi/100:2*pi;
>> y = sin(x);
>> plot(x,y)
```

Notes:

- 0:pi/100:2*pi yields a vector that
- starts at 0 ,
- takes steps (or increments) of $\pi / 100$,
- stops when $2 \pi$ is reached.
- If you omit the increment, MATLAB automatically increments by 1.

## Adding titles, axis labels, and annotations

MATLAB enables you to add axis labels and titles. For example, using the graph from the previous example, add an $x$ - and $y$-axis labels. Now label the axes and add a title. The character $\backslash p i$ creates the symbol $\pi$. An example of 2D plot is shown in Figure 2

Figure 2.2: Plot of the Sine function

```
>> xlabel('x = 0:2\pi')
>> ylabel('Sine of x')
>> title('Plot of the Sine function')
```

The color of a single curve is, by default, blue, but other colors are possible. The desired color is indicated by a third argument. For example, red is selected by plot ( $x, y$, ' $r$ '). Note the single quotes, ${ }^{\prime}$, , around $r$.
