## Physical Chemistry I Second Stage Lecture No. 1

Ass. Lec. Zahraa Abdulelah Hadi

Chemistry : is the scientific discipline involved with compounds composed of atoms, i.e. elements, and molecules, i.e. combinations of atoms: their composition, structure, properties, behavior and the changes they undergo during a reaction with other compounds.

Physical chemistry : is the study of the fundamental physical principles that govern the way that atoms, molecules, and other chemical systems behave. Physical chemists study a wide array of topics such as the rates of reactions (kinetics), the way that light and matter interact (spectroscopy), how electrons are arranged in atoms and molecules (quantum mechanics), and the stabilities and reactivities of different compounds and processes (thermodynamics).

## Ideal gas equation

The equation of ideal gas can be written as below:
$P V=n R T$

## Boyle's Law

According to Boyle's Law, the pressure ( P ) of a given mass of gas is inversely proportional to its volume $(\mathrm{V})$, provided that the temperature of the gas remains constant.

$$
\begin{aligned}
& V \alpha \frac{1}{P} \\
& P V=\text { constant } \\
& P_{1} V_{1}=P_{2} V_{2}
\end{aligned}
$$

Example: In an industrial process, a gas confined to a volume of 1 L at a pressure of 20 atm is allowed to flow into a 12 L container by opening the valve that connects the two containers. What is the final pressure of the gas?

## solution

Set up the problem by setting up the known and unknown variables. In this case, the initial pressure is $20 \mathrm{~atm}\left(\mathrm{P}_{1}\right)$, the initial volume is $1 \mathrm{~L}\left(\mathrm{~V}_{1}\right)$, and the new volume is $1 \mathrm{~L}+12 \mathrm{~L}=13 \mathrm{~L}\left(\mathrm{~V}_{2}\right)$, since the two containers are connected.
The new pressure $\left(\mathrm{P}_{2}\right)$ remains unknown.
$\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2}$
$(20 \mathrm{~atm})(1 \mathrm{~L})=\left(\mathrm{P}_{2}\right)(13 \mathrm{~L})$
20 atom $=(13) \mathrm{P}_{2}$
$\mathrm{P}_{2}=1.54 \mathrm{~atm}$.

The final pressure of the gas is 1.54 atm .

## Charles' Law

Describes the relationship between volume and temperature of gases at constant pressure and mass. With the same amount of gas he found that as the volume increases the temperature also increases.

$$
\begin{aligned}
& V \propto \mathrm{~T} \\
& \frac{V 1}{T 1}=\frac{V 2}{T 2}
\end{aligned}
$$

## Gay-Lussac's Law

The pressure and absolute temperature ( K ) of a gas are directly related at constant mass \& volume.

$$
\begin{gathered}
P \propto \stackrel{T}{P_{1}} \\
\frac{P_{1}}{T_{1}}=\frac{P_{2}}{T_{2}}
\end{gathered}
$$

Example: A balloon is filled to a volume of 2.2 L at a temperature of $22^{\circ} \mathrm{C}$. The balloon is then heated to a temperature of $71^{\circ} \mathrm{C}$. Find the new volume of the balloon.

## Solution

$$
\begin{gathered}
\frac{V_{1}}{T_{1}}=\frac{V_{2}}{T_{2}} \rightarrow \therefore V_{2}=\frac{V_{1} \times T_{2}}{T_{1}} \\
V_{2}=\frac{2.20 \mathrm{~L} \times 344 \mathrm{~K}}{295 \mathrm{~K}} \rightarrow . . V_{2}=2.57 \mathrm{~L}
\end{gathered}
$$

Example:The gas in an aerosol can is under a pressure of 3 atm at a temperature of $25^{\circ} \mathrm{C}$. It is dangerous to dispose of an aerosol can by incineration. What would the pressure in the aerosol can be at a temperature of $845^{\circ} \mathrm{C}$ ?

## Solution

$$
\begin{gathered}
\frac{P_{1}}{T_{1}}=\frac{P_{2}}{T_{2}} \rightarrow \therefore P_{2}=\frac{P_{1} \times T_{2}}{T_{1}} \\
P_{2}=\frac{3 \mathrm{~atm} \times 1118 \mathrm{~K}}{298 \mathrm{~K}} \rightarrow \therefore P_{2}=11.3 \mathrm{~atm}
\end{gathered}
$$

## Avogadro's Principle

Equal volumes of gases contain equal numbers of moles at constant temp \& pressure its true for any ideal gas.
$V \alpha n$

$$
\frac{V_{1}}{n_{1}}=\frac{V_{2}}{n_{2}}
$$

$$
\text { So } \quad V \alpha \frac{n T}{P}
$$

$V=22.4 \mathrm{~L}^{\mathrm{N}}$
$V=22.4 \mathrm{~L}$
$P=1 \mathrm{~atm}$
$T=0^{\circ} \mathrm{C}$
$T=0^{\circ} \mathrm{C}$
Mass: 28.013 Mass: $\mathbf{2 8 . 0 1 3} \mathrm{g} / \mathrm{mol}$
$n=1 \mathrm{~mol}$
$P V=n R T \ldots \ldots \ldots$ ideal $g a s$
$\therefore V=\frac{n R T}{P}$

$$
n=m / M_{w t} \quad \rightarrow \therefore P M_{w t}=(m / V) R T
$$

$\therefore M_{w t}=\frac{\rho R T}{P}$

Example: A balloon has been filled to a volume of 1.9 L with 0.092 mol of helium gas. If 0.021 mol of additional helium is added to the balloon while the temperature and pressure are held constant, what is the new volume of the balloon?

## Solution

Note that the final number of moles has to be calculated by adding the original number ofmoles to the moles of added helium.

$$
\begin{gathered}
n_{2}=0.0920+0.0210=0.1130 \mathrm{~mol} \\
\frac{V_{1}}{n_{1}}=\frac{V_{2}}{n_{2}} \rightarrow \therefore V_{2}=\frac{V_{1} \times n_{2}}{n_{1}} \\
V_{2}=\frac{1.90 \mathrm{~L} \times 0.1130 \mathrm{~mol}}{0.0920 \mathrm{~mol}} \rightarrow \therefore V_{2}=2.33 \mathrm{~L}
\end{gathered}
$$

## Dalton's Law of Partial Pressures

Dalton's Law, or the Law of Partial Pressures, states that the total pressure exerted by a mixture of gases is equal to the sum of the partial pressures of the gases in the mixture.

$$
\begin{aligned}
& P V=n R T \\
& P_{\text {total }}=P_{\boldsymbol{A}}+P_{\boldsymbol{B}}+\cdots \\
& n_{\text {total }}=n_{\boldsymbol{A}}+n_{\boldsymbol{B}}+\cdots \\
& \boldsymbol{P}_{\boldsymbol{t o t}} V=\boldsymbol{n}_{\boldsymbol{t o t}} \boldsymbol{R T} \\
& \frac{\boldsymbol{P}_{\boldsymbol{A}}}{\boldsymbol{P}_{\boldsymbol{t o t}}}=\frac{\boldsymbol{n}_{\boldsymbol{A}}}{\boldsymbol{n}_{\boldsymbol{t o t}}} \\
& \boldsymbol{P}_{\boldsymbol{t o t}} \boldsymbol{n}_{\boldsymbol{B}} \\
& \boldsymbol{n}_{\boldsymbol{t o t}}
\end{aligned}
$$

Example: 24.0 L of nitrogen gas at 2 atm and 12.0 L of oxygen gas at 2 atm are added to a 10 L container at 273 K . Find the partial pressure of nitrogen and oxygen and then find the total pressure.

## Solution

Find the number of moles of oxygen and nitrogen using $\mathrm{PV}=\mathrm{nRT}$ which is n=PV/RT

- oxygen: $((2 \mathrm{~atm})(12 \mathrm{~L})) /\left(0.08206 \mathrm{~atm} \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)(273 \mathrm{~K})=1.071 \mathrm{moles}$ oxygen
- nitrogen: $((2 \mathrm{~atm})(24.0 \mathrm{~L})) /\left(0.08206 \mathrm{~atm} \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)(273 \mathrm{~K})=2.143$ moles ofNitrogen
- add to get $n_{\text {tot }}: 1.071 \mathrm{~mol}_{\text {Oxygen }}+2.143 \mathrm{~mol}_{\text {Nitrogen }}=3.214$ moles total
- Use $\mathrm{PV}=\mathrm{nRT}$ or $\mathrm{P}=(\mathrm{nRT}) / \mathrm{V}$ to find the total pressure
- $\mathrm{P}_{\text {tot }}=\left(\left(3.214 \mathrm{~mol}_{\text {total }}\right)\left(0.08206\right.\right.$ atm $\left.\left.\mathrm{L} \mathrm{mol}^{-1} \mathrm{~K}^{-1}\right)(273 \mathrm{~K})\right) /(10.0$ $\mathrm{L})=7.200 \mathrm{~atm}$
- $\mathrm{P}_{\mathrm{A}} / \mathrm{P}_{\text {tot }}=\mathrm{n}_{\mathrm{A}} / \mathrm{N}_{\text {tot }}$ can be rearranged to $\mathrm{P}_{\mathrm{A}=\left(\mathrm{P}_{\text {tot }}\right)\left({ }^{n} \mathrm{~A}^{\left./ N_{\text {tot }}\right)} \text { to find the partial }\right.}$ pressures
- $\mathrm{P}_{\text {oxygen }}=\left(\begin{array}{ll}7.200 & \left.\text { atm }_{\text {total }}\right)\left(1.071 \mathrm{~mol}_{\text {Oxygen }} / 3.214 \quad \mathrm{~mol}_{\text {total }}\right)=2.399\end{array}\right.$ $\operatorname{atm}_{\text {Oxygen }}$
- $P_{\text {nitrogen }}=7.200$ atm $_{\text {total }}{ }^{-2.399} \mathrm{~atm}_{\text {Oxygen }}=4.801 \mathrm{~atm}_{\text {Nitrogen }}$
