Department of Anesthesia techniques

Third Stage

Introduction To SPSS

Asst. Lect. Raghda M. Alshemari

2021-2022

SPSS

- "Statistical Package for the Social Sciences" (SPSS)
- The package is widely used in the social and behavioral sciences.
- There are several forms of SPSS:
 - The core program is called SPSS Base.
 - a number of add-on modules that extend the range of data entry, statistical, or reporting capabilities.

Data Entry

- Most likely users will want to enter data or open an existing data file.
- At the top of the screen is a menu bar and at the bottom a status bar

<u>F</u> ile	<u>E</u> dit	<u>V</u> iew	<u>D</u> ata	<u>T</u> ransform	<u>A</u> nalyze	<u>G</u> raphs	<u>U</u> tilities	E <u>x</u> tensions	<u>W</u> indow	<u>H</u> elp	
2					ิ ช			PA H			

• The status bar informs the user about facilities currently active

The Data View Spreadsheet

- The Data Editor consists of two windows:
- The Data View, which allows the data to be entered and viewed.

The Variable View Spreadsheet

- The other window is the Variable View, which allows the types of variables to be specified and viewed.
- The Variable View spreadsheet serves to define the variables
- Each variable definition occupies a row of this spreadsheet
- As soon as data is entered under a column in the Data View, the default name of the column occupies a row in the Variable View.

7	1		_									1	

1. Name

- This can be up to eight alphanumeric characters but must begin with a letter.
- While the underscore (_) is allowed, hyphens (-), ampersands (&), and spaces cannot be used
- Variable names are not case sensitive.

2. Type

- SPSS provides a default variable type once variable values have been entered in a column of the Data View.
- offers a number of types of data including various formats for numerical data, dates, or currencies.

3. Width

- The default width of numerical variable entries is eight.
- The width can be increased or decreased by highlighting the respective cell in the third column and employing the upward or downward arrows appearing on the right-hand side of the cell .
- or by simply typing a new number in the cell.

4. Decimals

— the number of digits to the right of the decimal place to be displayed for data entries.

-This is not relevant for string data and for such variables the entry under the fourth column is given as a greyed-out zero.

5. Label

• a label attached to the variable name. In contrast to the variable name, this is not confined to eight characters and spaces can be used.

• They are helpful for reminding users of the meaning of variables (placing the cursor over the variable name in the Data View will make the variable label appear).

6. Values

• labels attached to category codes. For categorical variables, an integer code should be assigned to each category and the variable defined to be of type "numeric.

• clicking on the respective cell under the sixth column of the Variable View makes the three-periods symbol appear, and clicking this opens the Value Labels dialogue box, which in turn allows assignment of labels to category Codes

Value Labels		×
Value Labels Val <u>u</u> e: Label:		Spelling
0 = Add Change Remove	"female" "male"	
	OK Cancel Help	,

7. Missing — missing value codes.

8. Columns

- width of the variable column in the Data View. The default cell width for numerical variables is eight.
- Note that when the Width value is larger than the Columns value, only part of the data entry might be seen in the Data View.

9. Align

• alignment of variable entries. The SPSS default is to align numerical variables to the right-hand side of a cell and string variables to the left.

10. Measure

• — measurement scale of the variable. The default chosen by SPSS depends on the data type.

For example

- for variables of type "numeric," the default measurement scale is a continuous or interval scale (referred to by SPSS as "scale").
- For variables of type "string," the default is a nominal scale.
- The third option, "ordinal," is for cate
