LECTURE No. 9

BEAM DEFLECTION

Introduction

When we consider designing beams based on rigidity consideration the deflection of the beam must be known at specific or critical location. Several methods are available for determining beam deflection. Although based on the same principles, they differ in technique and in their immediate objective.

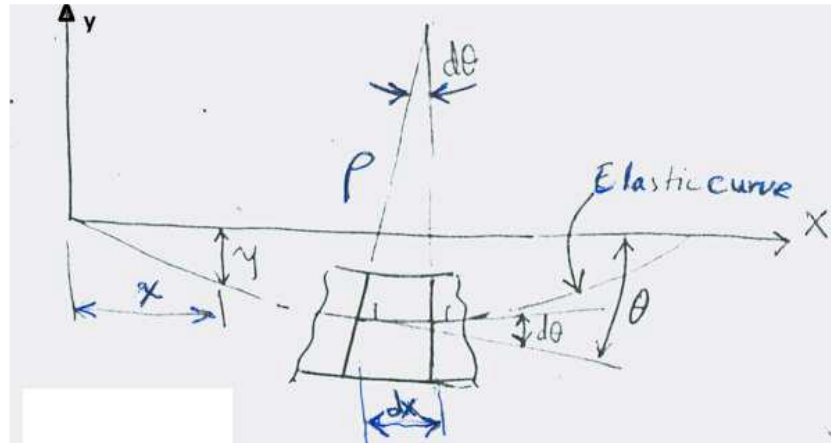

Methods of Determining Beam Deflections

Numerous methods are available for the determination of beam deflections. These methods include:

- Double-integration method
- Area-moment method
- Strain-energy method (Castigliano's Theorem)
- Conjugate-beam method
- Method of superposition

Double-integration method

The double integration method is a powerful tool in solving deflection and slope of a beam at any point because we will be able to get the equation of the elastic curve. *The double integration method can be used if the moment (M) has a single expression for the whole beam.*

$$\text{Slope} = \tan \theta = \frac{dy}{dx}$$

Since θ is small, then $\tan \theta \approx \theta$

$$\theta = \frac{dy}{dx} \text{ and } \frac{d\theta}{dx} = \frac{d^2y}{dx^2} \quad (1)$$

The differential length ds can be expressed in terms of radius of curvature ρ as:-

$$ds = \rho d\theta$$

$$\text{Or } \frac{1}{\rho} = \frac{d\theta}{ds} \approx \frac{d\theta}{dx} \quad (2)$$

Substitute eq.(1) and eq.(2)

$$\frac{1}{\rho} = \frac{d^2y}{dx^2} \quad (3)$$

In deriving the flexure formula (Bending Stress Lecture), we obtained the relation:

$$\frac{1}{\rho} = \frac{M}{EI} \quad (4)$$

Equating eq.(3) and (4), we have

$$EI \frac{d^2y}{dx^2} = M \quad (5)$$

This is known as the differential equation of the elastic curve of the beam.

Integrating equation (5), assuming EI constant, we obtain

$$EI \frac{dy}{dx} = \int M dx + c_1 \quad (\text{slope equation})$$

And

$$EI y = \int (\int M dx) dx + c_1 x + c_2 \quad (\text{deflection equation})$$

Example 1

Determine the maximum deflection δ in a simply supported beam of length L carrying a concentrated load P at midspan.

Class: 2 nd class
Subject: Strength of Materials
Lecturer: Mujtaba Al Khafaji
E-mail: mujtabaabdulkadhim@mustaqbal-college.edu.iq

Class: 2 nd class
Subject: Strength of Materials
Lecturer: Mujtaba Al Khafaji
E-mail: mujtabaabdulkadhim@mustaqbal-college.edu.iq

Example 2

Determine the maximum deflection δ in a simply supported beam of length L carrying a uniformly distributed load of intensity w_0 applied over its entire length.

Class: 2 nd class
Subject: Strength of Materials
Lecturer: Mujtaba Al Khafaji
E-mail: mujtabaabdulkadhim@mustaqbal-college.edu.iq

Class: 2 nd class
Subject: Strength of Materials
Lecturer: Mujtaba Al Khafaji
E-mail: mujtabaabdulkadhim@mustaqbal-college.edu.iq

Example 3

Determine the maximum deflection δ in a cantilever beam of length L carrying a concentrated load P at midspan.

Class: 2 nd class
Subject: Strength of Materials
Lecturer: Mujtaba Al Khafaji
E-mail: mujtabaabdulkadhim@mustaqbal-college.edu.iq

Example 3

Determine the maximum deflection δ in a cantilever beam of length L carrying a concentrated load P at midspan.
