M.Sc. Zahraa F. Hussain

### 1.8 HEATING LOAD ESTIMATION

The heating load evaluation is the foundation for selecting the heating equipment. Normally, the heating load is estimated for the winter design temperatures (Table 2) usually occurring at night; therefore, no credit is taken for the heat given off by internal sources (people, lights, etc.). This estimate must take into account the heat loss thru the building structure surrounding the spaces and the heat required to offset the outdoor air which may infiltrate and/or may be required for ventilation.

## HIGH ALTITUDE LOAD CALCULATIONS

Since air conditioning load calculations are based on liters of air necessary to handle a load, a decrease in density means an increase in Lit/s required to satisfy the given sensible load.

## 1- Heat Loss - Glass And Door

$$
\boldsymbol{Q}_{t / g}=\mathbf{U} \mathbf{A}_{\mathrm{g} / \mathrm{d}}\left(\mathbf{T}_{\mathbf{i}}-\mathbf{T}_{\mathbf{o}}\right)
$$

Where

$$
\boldsymbol{Q}_{t / g}=\text { Solar transmission window and door }
$$

$$
U=\text { Glass heat transfer coefficient }
$$

$$
W / m^{2}{ }^{\circ} \mathrm{C}
$$

(T20)

$$
\boldsymbol{A}_{\boldsymbol{g} / \boldsymbol{d}}=\text { Window or door area } \quad \boldsymbol{m}^{2}
$$

$\left(T_{i}-T_{o}\right)=$ Outdoor, indoor Temperature

$$
{ }^{\circ} \mathrm{C}
$$

## 2. HEAT LOSS - WALLS AND ROOFS

$$
Q_{t / R}=\mathbf{U} A_{\mathbf{R}}\left(\mathbf{T}_{\mathbf{i}}-\mathbf{T}_{\mathbf{o}}\right)
$$

Where

$$
Q_{t / R}=\text { Solar transmission Roof Or Wall }
$$

$\boldsymbol{U}=$ Roof or Wall heat transfer coefficient

$$
W / m^{2}{ }^{\circ} \mathrm{C}
$$

(T19)

$$
A_{R}=\text { Roof or Wall area }
$$

$$
m^{2}
$$

$\left(T_{i}-T_{o}\right)=$ Outdoor, indoor Temperature

$$
{ }^{\circ} \mathrm{C}
$$

## 3. HEAT LOSS -FLOORS a- FLOOR AREA

$$
Q_{t / F}=\mathbf{U} A_{\mathbf{F}}\left(\mathbf{T}_{\mathbf{i}}-\mathbf{1 0}\right)
$$

Where

$$
\boldsymbol{Q}_{\boldsymbol{t} / \boldsymbol{F}}=\text { Solar transmission Floor } \quad W
$$

$\boldsymbol{U}=$ Floor heat transfer coefficient

$$
W / m^{2 \circ} \mathrm{C}
$$

(T19)

$$
A_{\mathrm{F}}=\text { Floor area }
$$

$\left(T_{i}-10\right)=$ indoor Temperature

## 3. HEAT LOSS -FLOORS b- FLOOR EDGES

$$
Q_{t / F}=0.8 P\left(T_{i}-10\right)
$$

Where
$\boldsymbol{Q}_{\boldsymbol{t} / \boldsymbol{F}}=$ Solar transmission Floor

$$
0.8=\text { Factor } \quad W / m^{\circ} \mathrm{C}
$$

$$
P=\text { Floor perimeter }
$$

$$
m
$$

$\left(T_{i}-10\right)=$ indoor Temperature

Room perimeter can be calculated as follows $P=2 \times(L+W)$

## 4. Heat Transmission Partition

## 5- Infiltration

## 5. INFLITRATION

i- Depending on windows or doors area:

ii- Depending on the crack length $L_{C}$
Depends on figure 6 , for single hung window or door, crack length can be calculated as follows:
$\mathrm{L}_{\mathrm{C}}=2 .(\mathrm{H}+\mathrm{W})$
While for double hung window or door
LC $=2 .(H+W)+H$

LC $=2 .(H+W)+H$

| $\boldsymbol{I O A}=\boldsymbol{N o} \boldsymbol{L}_{\boldsymbol{c}} \boldsymbol{V}$ |  |  |  |
| :---: | :---: | :--- | :--- |
|  | Volume flow rate/m <br> Number of window <br> and doors | - | $\mathrm{T}(24)$ |
|  | Outdoor air | $\mathrm{Lit} / \mathrm{s}$ |  |

Figure 6 single and double hung windows

## 6- Ventilation:

i- Outdoor air ventilation depending on the number of people:

ii- Outdoor air ventilation depending on the floor area

| $\mathrm{V}{ }^{=} \mathrm{A} . \quad R_{a}$ |  |  |  |
| :---: | :--- | :--- | :--- |
|  |  | Volume flow rate/area | Lit/s per m |
|  |  |  |  |
|  | Floor area | $\mathrm{T}(25)$ |  |
|  |  | $\mathrm{m}^{2}$ |  |

A- Outdoor Air Sensible heat OASH

| $Q_{s}=1.2$ VOA $\left(T_{i}-T_{o}\right)$ |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  |  | Outdoor, indoor | ${ }^{\circ} \mathrm{C}$ |  |
|  |  | Ventilation rate | $\mathrm{Lit} / \mathrm{s}$ |  |
|  | Factor |  |  |  |

B- Outdoor Air Latent Heat OALH

C- Outdoor air Total Heat OATH

6- TOTAL HEATING LOAD
$\sum Q_{g}+Q_{d}+Q_{\text {wall }}+Q_{\text {Floor }}+Q_{\text {Roof }}+Q_{\text {Ventilation }}$

## Example 3.

A single-family detached house shown in Fig. 1a is located in Iraq- Baghdad. The Wall is built from of 13 mm cement plaster, 20 cm common brick and 10 mm gypsum plaster. While the Partition is built from 10 cm common brick and 10 mm gypsum plaster on both sides. The Roof is built from outside to inside from 10 mm cement tail, 130 mm sand, 10 mm Expanded polyurethane, Asphalt shingles, 150 mm concrete and 20 mm gypsum. The floor consist from outer to inner from carp, cement tile of 25 mm thick., heavy concert of 15 cm thick. Ceiling height is 3 m Fenestration. Clear single glass, 3 mm thick. Assume closed, medium-color well fitted, aluminum frame. Doors made of wood of 25 mm thickness. Occupancy. Four persons, based on two for the master bedroom and one for each additional bedroom. Assign to the living room. Llights. Assume 480 W for the kitchen, and 480 W for living room, assign $50 \%$ to bed room 1, $25 \%$ for bedrooms 2 and 3. Appliances : there is one TV,PC laptop, laser printer, and Coffee brewer in living room, The construction of the house is considered medium. Find the sensible, latent, and total Heating load; size the heating unit; and compute the air quantity for each room.

## Area of Building

| Room name | Net area of outer Walls ( $\mathrm{m}^{2}$ ) |  |  |  | Windows |  |  |  |  | Floor ( $\mathrm{m}^{2}$ ) | Roof ( $\mathrm{m}^{2}$ ) | Perimeter | Partition |
