

Couples

The moment produced by two equal, opposite, and noncollinear forces is called a *couple*. Couples have certain unique properties and have important applications in mechanics. Consider the action of two equal and opposite forces \mathbf{F} and $-\mathbf{F}$ a distance d apart, as shown in Figure. These two forces cannot be combined into a single force because their sum in every direction is zero. Their only effect is to produce a tendency of rotation. The combined moment of the two forces about an axis normal to their plane and passing through any point such as a in their plane is the couple M . This couple has a magnitude

$$M = F(a + d) - Fa$$

Or

$$M = Fd$$

Equivalent Couples

Changing the values of \mathbf{F} and \mathbf{d} does not change a given couple as long as the product $\mathbf{F}\mathbf{d}$ remains the same. Likewise, a couple is not affected if the forces act in a different but parallel plane. Figure shows four different configurations of the same couple \mathbf{M} . In each of the four cases, the couples are equivalent and are described by the same free vector which represents the identical tendencies to rotate the bodies.

Force-Couple Systems

The replacement of a force by a force and a couple is illustrated in Figure, where the given force F acting at point A is replaced by an equal force F at some point B and the counterclockwise couple $M = Fd$.

Problem 1

The rigid structural member is subjected to a couple consisting of the two 100-N forces. Replace this couple by an equivalent couple consisting of the two forces P and - P , each of which has a magnitude of 400 N. Determine the proper angle θ .

Solution

$$M = Fd$$

$$M = 100(0.1) = 10\text{N}\cdot\text{m}$$

The forces P and - P produce a counterclockwise couple

$$M = 400 (0.040) \cos \theta$$

$$10 = 400(0.040) \cos \theta$$

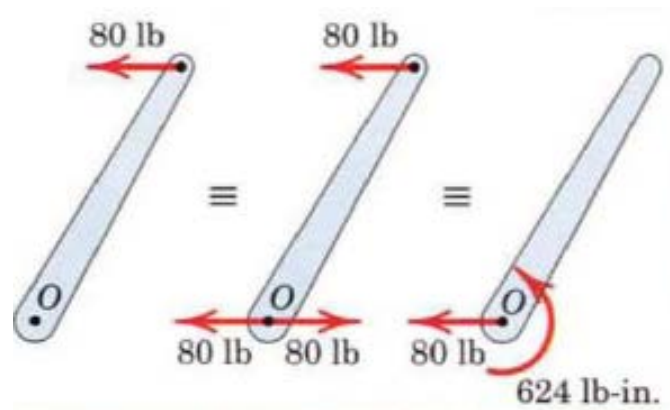

$$\theta = \cos^{-1} \frac{10}{16} = 51.3$$

Problem 2

Replace the horizontal 80· lb force acting on the lever by an equivalent system consisting of a force at O and a couple.

Solution

We apply two equal and opposite 80· lb forces at O and identify the counterclockwise couple

$$M = Fd$$

$$M = 80(9 \sin 60) = 624 \text{ lb-in.}$$

Problem 3

The indicated force- couple system is applied to a small shaft at the center of the rectangular plate. Replace this system by a single force and specify the coordinate of the point on the y-axis through which the line of action of this resultant force passes.

Solution

$$\begin{aligned} \curvearrowright M &= Fd: 375 = 5000d \\ d &= 0.075 \text{ m} \\ \therefore \underline{y} &= \underline{-75 \text{ mm}} \end{aligned}$$

Problem 4

The top view of a revolving entrance door is shown. Two persons simultaneously approach the door and exert forces of equal magnitudes as shown. If the resulting moment about the door pivot axis at O is 25 N .m, determine the force magnitude F.

Solution

$$\begin{aligned}
 \curvearrowright M_o &= \Sigma Fd \\
 25 &= 2 F(\cos 15^\circ)(0.8) \\
 F &= \underline{16.18 \text{ N}}
 \end{aligned}$$
