

Introduction to MATLAB

1. What is MATLAB?

MATLAB is a high-performance language for technical computing. It integrates computation, visualization, and programming in an easy-to-use environment where problems and solutions are expressed in familiar mathematical notation.

It's name is derived from **MATrix LABoratory**.

2. High-level language

- Data types
- Functions
- Control flow statements
- Input/output
- Graphics
- Object-oriented programming capabilities

3. Typical Uses of MATLAB

- Math and computation
- Algorithm development
- Data acquisition
- Modeling, simulation, and prototyping
- Data analysis, exploration, and visualization
- Scientific and engineering graphics
- Application development including Graphical user interfaces (GUI) building.

4. Why Use MATLAB?

Advantages:

- Handles vector and matrices very nice
- Quick plotting and analysis
- EXTENSIVE documentation (type 'help')
- Lots of nice functions: FFT, fuzzy logic, neural nets, numerical integration.

Drawbacks:

- Slow compared to C or Java.

5. Toolboxes

Collections of functions to solve problems from several application fields.

- DSP (Digital Signal Processing) Toolbox
- Image Toolbox
- Wavelet Toolbox
- Neural Network Toolbox
- Fuzzy Logic Toolbox
- Control Toolbox
- Multibody Simulation Toolbox
- And many others...

6. MATLAB Desktop Tools

When you start MATLAB, a special window called the MATLAB desktop appears. The desktop is a window that contains other windows. The major tools within or accessible from the desktop are:

- Command Window
- Command History
- Current Directory Browser
- Workspace Browser
- Editor/Debugger
- Help Browser

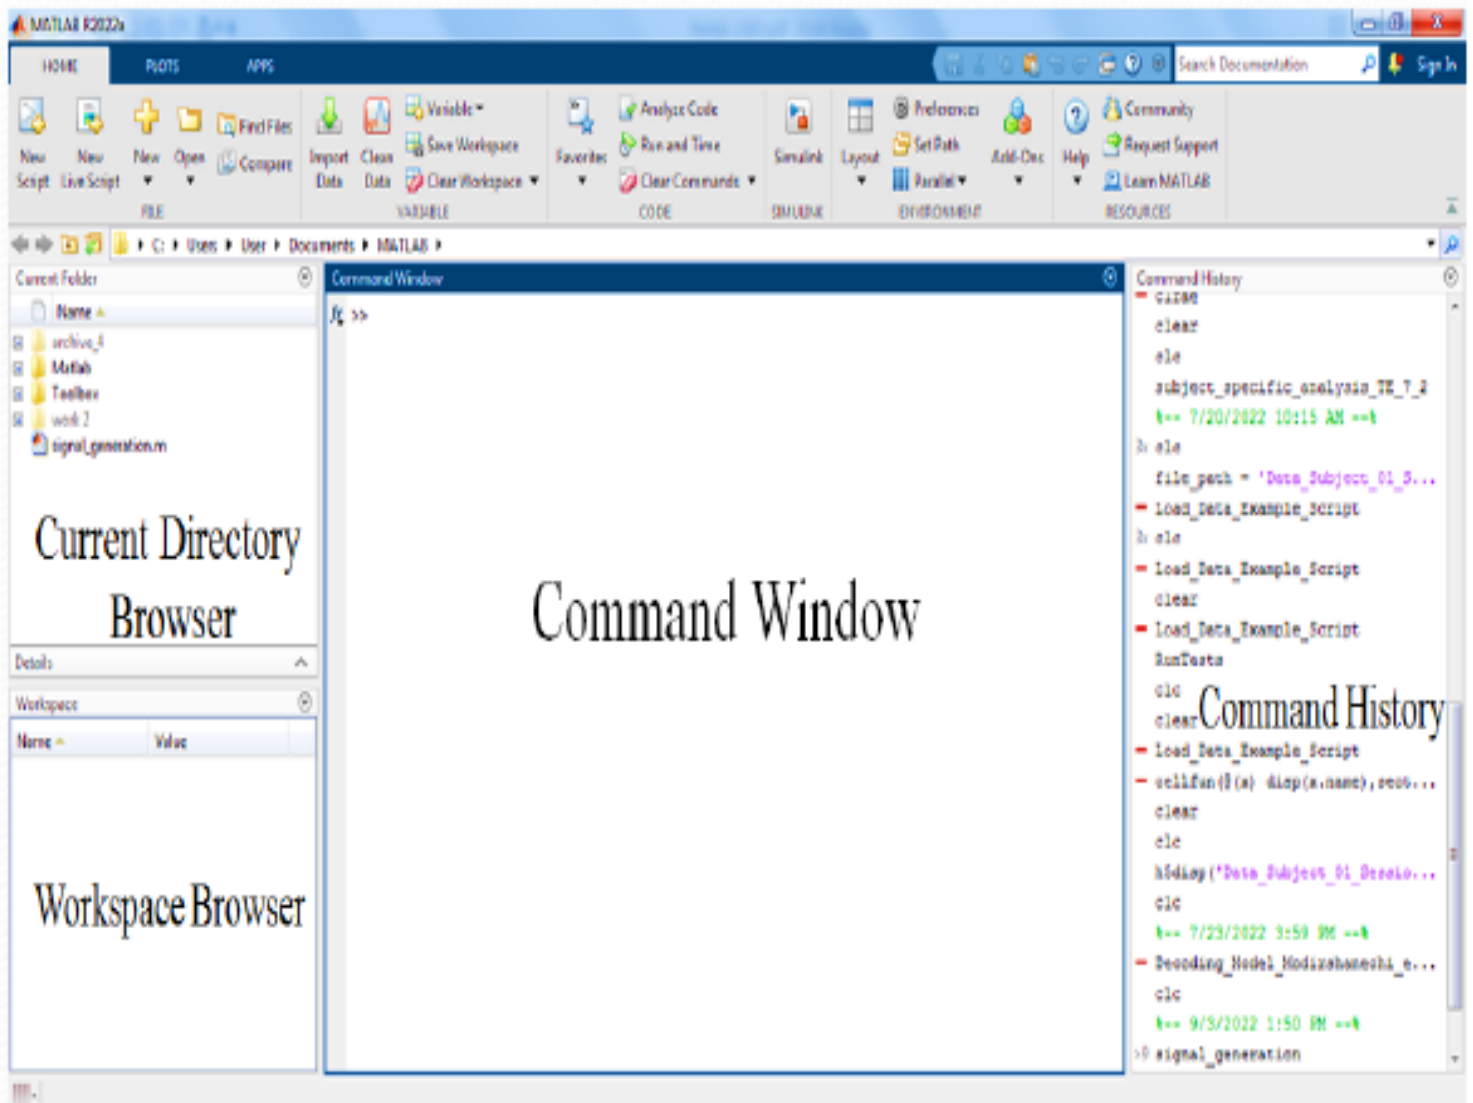

To select what you want to see, go under “Desktop” tab.

Desktop Tools

- **Command Window:** Use the Command Window to enter variables and run functions and M-files.
- **Command History:** Statements you enter in the Command Window are logged in the Command History. In the Command History, you can view previously run statements, and copy and execute selected statements.
- **Current Directory Browser:** MATLAB file operations use the current directory reference point. Any file you want to run must be in the current directory or on the search path.

- **Workspace:** The MATLAB workspace consists of the set of variables (named arrays) built up during a MATLAB session and stored in memory.

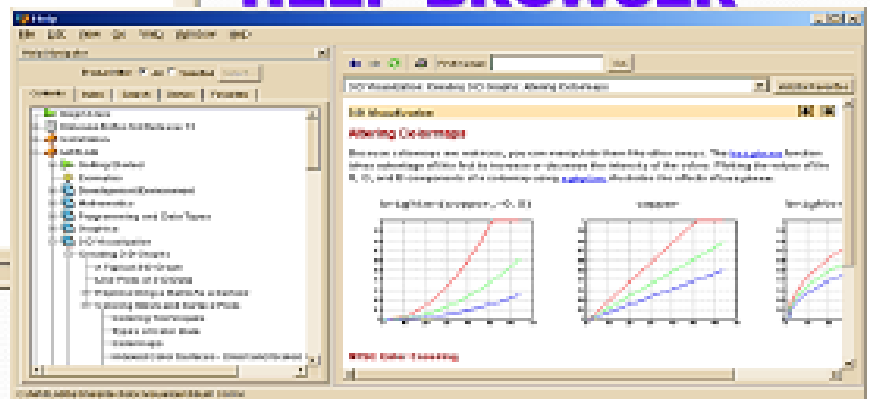

Editor/Debugger

```
1 % DEFINE - Create and initialize a linear layer.  
2 % ADAPT - Train a linear layer with Mean-Square error.  
3 % ADAPTIVE LINEAR PREDICTION:  
4 % Write the above functions a linear neuron is adaptively  
5 % trained to produce the next value in a signal, given the  
6 % last five values of the signal.  
7 % The linear neuron is able to adapt to changes in the  
8 % signal as it keeps to produce.  
9 pause % Strike any key to continue...  
10  
11 % DEFINING A NERVE FIBRE  
12 % =====  
13 % TIME1 and TIME2 define two segments of nerve.  
14 % time1 = [0:0.01:4] % from 0 to 4 seconds  
15 % time2 = 4.01:0.01:8 % from 4 to 8 seconds  
16  
17 % TIME defines all the time steps of this simulation.  
18 % time = [time1 time2] % from 0 to 8 seconds  
19  
20 % T defines a signal which changes frequency over  
21 % time: [cos(2*pi*t)/10+sin(2*pi*t)/10] %  
22  
23 % The input I to the network is the sum of the
```

HELP BROWSER

7. Using MATLAB as a calculator

For example, let's suppose you want to calculate the expression, $1 + 2 * 3$

3. You type it at the prompt command (\gg) as follows,

```
\gg 1+2*3  
ans =  
7
```

Note that the variable `ans` is created (or overwritten, if it is already existed). To avoid this, you may assign a value to a variable or output argument name. For example,

```
\gg x = 1+2*3  
x =  
7
```

Notes:

1- A semicolon " ; " at the end of a MATLAB statement suppresses printing of results.

For example:

```
>> x = 3;
```

```
>> y = x + 5
```

When you click execute bottom, MATLAB executes it immediately and the result returned is:

```
>> y = 8
```

2- If a statement does not fit on one line, use " . . . ", followed by Enter to indicate that the statement continues on the next line.

For example:

```
>> S= sqrt (225)*30 /...  
(20*sqrt (100))
```

3- Adding comments

The percent symbol (%), is used for indicating a comment line.

For example:

```
>> x = 9      % assign the value 9 to x
```

the statement will appear in green color.
