## Matrices

## 1. Entering matrices

Entering matrices into Matlab is the same as entering a vector, except each row of elements is separated by a semicolon (;) or a return:

$$
\text { >>B = [1 } 23 \text { 4; } 5678 ; 91011 \text { 12] }
$$

$$
\begin{array}{rccc}
B= & & & \\
1 & 2 & 3 & 4 \\
5 & 6 & 7 & 8 \\
9 & 10 & 11 & 12
\end{array}
$$

Alternatively, you can enter the same matrix as follows:

```
>>B = [1 12 3 4
```

5678
91011 12]
$B=$
$\begin{array}{llll}1 & 2 & 3 & 4\end{array}$
$\begin{array}{llll}5 & 6 & 7 & 8\end{array}$
$\begin{array}{llll}9 & 10 & 11 & 12\end{array}$
Note how the matrix is defined, using brackets and semicolons to separate the different rows.

## 2. Transpose

The special character prime ' denotes the transpose of a matrix e.g.

```
>> \(A=[123 ; 456 ; 789]\)
A =
    123
    456
    \(\begin{array}{lll}7 & 8 & 9\end{array}\)
    >> \(B=A^{\prime}\)
B =
    147
    258
    369
```

## 3. Matrix operations

### 3.1 Addition and subtraction

Addition and subtraction of matrices are denoted by + and - . This operations are defined whenever the matrices have the same dimensions.

For example: If A and B are matrices, then Matlab can compute A+B and A-B when these operations are defined.

```
>> \(A=\left[\begin{array}{lll}1 & 2 ; 4 & 5 \\ 6 ; 7 & 8 & 9\end{array}\right]\)
A =
    123
    456
    \(\begin{array}{lll}7 & 8 & 9\end{array}\)
>> \(B=\left[\begin{array}{llllll}1 & 1 & 1 ; 2 & 2 & 2 ; 3 & 3\end{array}\right]\)
B =
    111
    222
    \(3 \quad 3 \quad 3\)
>> C = 1 2;3 4;5 6]
C =
    12
    34
    56
```

>> A+B
ans =
$\begin{array}{lll}2 & 3 & 4\end{array}$
$\begin{array}{lll}6 & 7 & 8\end{array}$
$\begin{array}{lll}10 & 11 & 12\end{array}$
$\gg \mathrm{A}+\mathrm{C}$
??? Error using ==>+
Matrix dimensions must agree.
Matrices can be joined together by treating them as elements of vectors:
$\gg D=\left[\begin{array}{ll}A B]\end{array}\right.$
D =
$\begin{array}{llllll}1 & 2 & 3 & 1 & 1 & 1\end{array}$
$\begin{array}{llllll}4 & 5 & 6 & 2 & 2 & 2\end{array}$
$\begin{array}{llllll}7 & 8 & 9 & 3 & 3 & 3\end{array}$
>>A-2.3
ans =
-1.3000 -0.3000 0.7000
$1.7000 \quad 2.7000 \quad 3.7000$
$4.7000 \quad 5.7000 \quad 6.7000$

### 3.2 Matrix multiplication

Matrix operations simply act identically on each element of an array. We have already seen some vector operations, namely + and -, which are defined for vectors the same as for matrices. But the operators $*, /$ and $\wedge$ have different matrix interpretations.

```
>> \(A=[1,2,3 ; 4,5,6 ; 7,80]\)
A =
    123
    456
    780
>> \(\mathrm{B}=[1,4,7 ; 2,5,8 ; 3,6,0]\)
B =
    147
    258
    360
>> \(A^{*} B\)
ans =
    \(\begin{array}{lll}14 & 32 & 23\end{array}\)
    \(\begin{array}{lll}32 & 77 & 68\end{array}\)
    \(\begin{array}{lll}23 & 68 & 113\end{array}\)
```

### 3.3 Matrix division

To recognize how the two operator / and $\backslash$ work ;
$\mathrm{X}=\mathrm{A} \backslash \mathrm{B}$ is a solution to $\mathrm{A} * \mathrm{X}=\mathrm{B}$
$\mathrm{X}=\mathrm{B} / \mathrm{A}$ is a solution to $\mathrm{X} * \mathrm{~A}=\mathrm{B}$
>>A=[1,2,3;4,5,6;7,8 0]; B=[1,4,7;2,5,8;3,6,0];
>>X=A\B
ans =
-0.3333 -3.3333 -5.3333
$\begin{array}{llll}0.6667 & 3.6667 & 4.6667\end{array}$
$0 \quad-0.00001 .0000$
$\gg X=B / A$
X =
$\begin{array}{lll}3.6667 & -0.6667 & 0.0000\end{array}$
$3.3333-0.33330 .0000$
4.0000 -2.0000 1.0000

### 3.4 Element-wise operation

You may also want to operate on a matrix element-by-element. To get element-wise behavior appropriate for an array, precede the operator with a dot. There are two important operators here .* and ./
A.*B is a matrix containing the elements of A multiplied by the corresponding elements of B. Obviously A and B must have the same size. The ./ operation is similar but does a division. There is a similar operator.$^{\wedge}$ which raises each element of a matrix to some power.

```
>> \(\mathrm{E}=\left[\begin{array}{ll}1 & 2 ; 34\end{array}\right]\)
\(\mathrm{E}=\)
    12
    34
>> \(F=[23 ; 4\) 5]
F=
    23
    45
\(\gg \mathrm{G}=\mathrm{E} .{ }^{*} \mathrm{~F}\)
G =
    26
    1220
```

If you have a square matrix, like E , you can also multiply it by itself as many times as you like by raising it to a given power.

```
>>E^3
```

ans =
$37 \quad 54$
81118

If wanted to cube each element in the matrix, just use the element-by-element cubing.

```
>> E.^3
```

ans =
18
2764
>> $A=\left[\begin{array}{ll}123 ; 4 & 5 ; 789\end{array}\right] ;$
1./A
ans =
$\begin{array}{lll}1.0000 & 0.5000 & 0.3333\end{array}$
$0.2500 \quad 0.2000$
0.1667
$\begin{array}{lll}0.1429 & 0.1250 & 0.1111\end{array}$

```
\(\gg\) A./A
ans =
    111
    111
    111
```

Most elementary functions, such as sin, exp, etc., act element-wise.

```
\(\gg \cos \left(A^{*} \mathrm{pi}\right)\)
```

ans =
$\begin{array}{lll}-1 & 1 & -1\end{array}$
1 -1 1
$-1 \quad 1 \quad-1$
$\gg \exp (A)$
ans =
$1.0 \mathrm{e}+003$ *
$0.0027 \quad 0.0074 \quad 0.0201$
$0.0546 \quad 0.1484 \quad 0.4034$
$1.0966 \quad 2.9810 \quad 8.1031$

## 4. The Colon Operator

The colon operator can also be used to create a vector from a matrix. Define:
>> A = [1 2 3;4 5 6;7 8 9];
$\gg B=A(:, 1)$
B =
1
4
7
Note that the expressions before the comma refer to the matrix rows and after the comma to the matrix columns.

```
>> B=A(:,2)
B =
    2
        5
        8
>> B=A(1,:)
B =
    1 2
```

The colon operator is also useful in extracting smaller matrices from larger matrices. If the $4 \times 3$ matrix $C$ is defined by

```
C =
    \(\begin{array}{lll}-1 & 0 & 0\end{array}\)
    110
    1 -1 0
    \(0 \quad 0\)
>> D=C(:,2:3)
```

creates the following $4 \times 2$ matrix:
D =
00
10
-1 0
02
>> D=C(3:4,1:2)

Creates a $2 \times 2$ matrix in which the rows are defined by the 3rd and 4th row of C and the columns are defined by the 1st and 2nd columns of the matrix, C .

D =
1 -1
00

## 5. Referencing elements

The colon is often a useful way to construct these indices.
>> A = [1 2 3;4 5 6;7 8 9];
>> A(:,3)=0
Evaluated the third column to zero.
A =
120
450
780
>> $A(:, 3)=[]$
Deleted the third column.
A =
12
45
78
>> $A(3,:)=[]$
Deleted the third row.
A =
12
45
$\gg A(: 3)=5$
Expand the matrix into $2 \times 3$ matrix, with a the values of the third column equal to 5 .
A =
125
455
$\gg A(3,:)=7: 9$
Expand the matrix into $3 \times 3$ matrix, with a values of the third column equal to $7,8,9$ :
A =
125
455
$7 \quad 8 \quad 9$
An array is resized automatically if you delete elements or make assignments outside the current size. (Any new undefined elements are made zero.)
> $A(:, 5)=10$
Expand the matrix into $3 \times 5$ matrix, with a values of the fourth column equal to 0 and the last column equal to 10 :
$\mathrm{A}=$

| 1 | 2 | 5 | 0 | 10 |
| :--- | :--- | :--- | :--- | :--- |
| 4 | 5 | 5 | 0 | 10 |
| 7 | 8 | 9 | 0 | 10 |

## 6. Matrix Inverse

The function inv is used to compute the inverse of a matrix. Let, for instance, the matrix A be defined as follows:
$\gg A=\left[\begin{array}{lll}1 & 2 ; 4 & 5 ; 7 \\ \text { 6 10 }\end{array}\right]$
A =
123
456
$\begin{array}{lll}7 & 8 & 10\end{array}$
Then,
$\gg B=\operatorname{inv}(A)$
$B=$
-0.6667-1.3333 1.0000
-0.6667 3.6667-2.0000
1.0000 -2.0000 1.0000

The inverse of matrix $A$ can be found by using either $\mathrm{A}^{\wedge}(-1)$ or $\operatorname{inv}(\mathrm{A})$.

211
122
212
$\gg$ Ainv=inv(A)
Ainv =
2/3-1/3 0
2/3 2/3-1
-1 01
Let's verify the result of A*inv(A).
>> A*Ainv
ans =
100
010
001
Also let's verify the result of $\operatorname{inv}(A) * A$
>> Ainv*A
ans =
100
010
001
Note: There are two matrix division symbols in Matlab, / and $\backslash$ in which
$\mathbf{a} / \mathbf{b}=\mathbf{a} * \operatorname{inv}(\mathbf{b})$
$\mathbf{a} \backslash \mathbf{b}=\operatorname{inv}(\mathbf{a}) * \mathbf{b}$.

## 7. Predefined Matrix

Sometimes, it is often useful to start with a predefined matrix providing only the dimension. A partial list of these functions is:
zeros: matrix filled with 0 .
ones: matrix filled with 1.
eye: Identity matrix.
Finally, here are some examples on this special matrices
>>A=zeros(2,3)
A =
000
000
>>B=ones $(2,4)$
B =
1111
1111
>>C=eye(3)
C =
100
010
001

## 8. Other Operations on Matrix

Define a matrix M and examine the effect of each command separately:
>>M=[23 0 3;16 85;13 2 4;1 10 7]
M =
2303
1685
$\begin{array}{lll}13 & 2 & 4\end{array}$
$\begin{array}{lll}1 & 10 & 7\end{array}$
>>length(M) number of rows in M
4
>>size(M) matrix size (rows, columns)
43
$\gg$ find(M>7) finds indices of elements greater than 7 .
1
2
3
6
8
>>Sum(M) sum of elements in each column
$\begin{array}{lll}53 & 20 & 19\end{array}$
$\gg \max (\mathrm{M})$ maximum element in each column.

## $23 \quad 10$ <br> 7

$\gg \min (\mathrm{M})$ minimum element in each column

```
1 0 3
>>mean(M) mean of elements in each column
13.2500 5.0000 4.7500
>>Sort(M) sorts each column prod(M) product of elements in each column
    1 0 3
    13 2 4
    16 8
    23
>>all(M) 1 if all elements nonzero, 0 if any element nonzero
    1 0 1
>>abs(M) vector with absolute value of all elements
    23 0 3
    16 8
    13 2 4
    1 10 7
```

## Exercise 1:

Start with a fresh M-file editing window. Write a code to convert the temperature in Celsius into ${ }^{\circ} \mathrm{F}$ and then into ${ }^{\circ} \mathrm{R}$ for every temperature from 0 increasing 15 to $100^{\circ} \mathrm{C}$. Combine the three results into one matrix and display them as a table.

## Solution:

tc $=[0: 15: 100] ; \%$ tc is temperature Celsius, tf is temp deg F ,
tf = 1.8. ${ }^{*}$ tc + 32; \% and tr is temp deg Rankin.
tr = tf + 459.69;
t = [tc',tr',tr'] \% combine answer into one matrix

The results will be
$\mathbf{t}=$

| 0 | 32.0000 | 491.6900 |
| :---: | :---: | :---: |
| 15.0000 | 59.0000 | 518.6900 |
| 30.0000 | 86.0000 | 545.6900 |
| 45.0000 | 113.0000 | 572.6900 |
| 60.0000 | 140.0000 | 599.6900 |
| 75.0000 | 167.0000 | 626.6900 |
| 90.0000 | 194.0000 | 653.6900 |

## Exercise 2:

Use vectors with the aid of interp1 command to find the bubble point of ternary system (Ethanol $40 \mathrm{~mol} \%$, Water $20 \mathrm{~mol} \%$ and Benzene $40 \mathrm{~mol} \%$ ). Knowing that the vapor pressure for three components are calculated by:

Ethanol $\quad \mathrm{P}_{\mathrm{e}}^{\mathrm{o}}=\exp (18.5242-3578.91 /(\mathrm{T}-50.5))$
Water $\quad \mathrm{P}_{\mathrm{w}}^{\mathrm{o}}=\exp (18.3036-3816.44 /(\mathrm{T}-46.13))$
Benzene $\quad \mathrm{P}^{\mathrm{o}}{ }_{\mathrm{b}}=\exp (15.9008-2788.51 /(\mathrm{T}-52.36))$
Where
$\mathrm{K}_{\mathrm{i}}=\mathrm{P}_{\mathrm{i}}^{0} / \mathrm{P}_{\mathrm{t}}, \mathrm{P}_{\mathrm{t}}=760$, $\mathrm{y}_{\mathrm{i}}=\mathrm{K}_{\mathrm{i}} \times \mathrm{X}_{\mathrm{i}}$, At Bubble point $\sum \mathrm{yi}=\sum \mathrm{Ki} \times \mathrm{xi}=1$
Solution:
$\mathrm{Xe}=0.4$;
$X w=0.2 ;$
$\mathrm{Xb}=0.4$;
T=[60:5:100]+273.15;
$\mathrm{Pe}=\exp (18.5242-3578.91 . /(\mathrm{T}-50.5))$;
Pw=exp(18.3036-3816.44./(T-46.13));
$\mathrm{Pb}=\exp (15.9008-2788.51 . /(\mathrm{T}-52.36))$;
Ke=Pe/760;
Kw=Pw/760;
$\mathrm{Kb}=\mathrm{Pb} / 760$;
Ye=Ke*Хe;
Yw=Kw*Xw;
$\mathrm{Yb}=\mathrm{Kb}{ }^{*} \mathrm{Xb}$;
Ys=Ye+Yw+Yb;
A=[T',Ye',Yw',Yb',Ys']
TBp=interp1(Ys,T,1)
The output of the above code will be:

$$
A=
$$

| 333.1500 | 0.1850 | 0.0393 | 0.2060 | 0.4304 |
| :--- | :--- | :--- | :--- | :--- |
| 338.1500 | 0.2305 | 0.0494 | 0.2451 | 0.5250 |
| 343.1500 | 0.2852 | 0.0615 | 0.2899 | 0.6366 |
| 348.1500 | 0.3502 | 0.0761 | 0.3409 | 0.7672 |
| 353.1500 | 0.4271 | 0.0935 | 0.3987 | 0.9194 |
| 358.1500 | 0.5176 | 0.1141 | 0.4640 | 1.0958 |
| 363.1500 | 0.6235 | 0.1384 | 0.5373 | 1.2992 |
| 368.1500 | 0.7466 | 0.1668 | 0.6194 | 1.5328 |
| 373.1500 | 0.8890 | 0.2000 | 0.7107 | 1.7997 |

## TBp =

355.4352

## Practice Problems

1) Write a program to make a table of the physical properties for water in the range of temperatures from 273 to 323 K .

The Density : $\quad \rho=\mathbf{1 2 0 0 . 9 2} \mathbf{- 1 . 0 0 5 6} \mathbf{T}+\mathbf{0 . 0 0 1 0 8 4} \mathbf{T}^{\mathbf{2}}$
The conductivity: $K=\mathbf{0 . 3 4}+\mathbf{9 . 2 7 8} * \mathbf{1 0}^{-4} \mathbf{T}$
The Specific heat: $\mathbf{C}_{\mathbf{P}}=\mathbf{0 . 0 1 5 5 3 9}(\mathbf{T}-\mathbf{3 0 8 . 2})^{\mathbf{2}}+\mathbf{4 1 8 0 . 9}$
2) Define the $5 \times 4$ matrix, g.

$$
g=\left[\begin{array}{cccc}
0.6 & 1.5 & 2.3 & -0.5 \\
8.2 & 0.5 & -0.1 & -2.0 \\
5.7 & 8.2 & 9.0 & 1.5 \\
0.5 & 0.5 & 2.4 & 0.5 \\
1.2 & -2.3 & -4.5 & 0.5
\end{array}\right]
$$

Find the content of the following matrices and check your results for content using Matlab.
a) $\mathrm{a}=\mathrm{g}(:, 2)$
b) $\mathrm{a}=\mathrm{g}(4,:)$
c) $a=g(4: 5,1: 3)$
d) $a=g(1: 2: 5,:)$
e) $a=\operatorname{sum}(g)$
3) Given the arrays $x=\left[\begin{array}{ll}1 & 3\end{array}\right], y=\left[\begin{array}{ll}2 & 4 \\ 6\end{array}\right]$ and $A=\left[\begin{array}{lll}3 & 15 ; 597\end{array}\right]$, Calculate;
a) $x+y$
b) $x^{\prime}+y^{\prime}$
c) $\mathrm{A}-[\mathrm{x} ; \mathrm{y}]$
d) $[x ; y] . * A$
e) $\mathrm{A}-3$
