Organic Chemistry

Lecture 1

Introduction to Organic Chemistry

By

Dr. Assel Amer Hadi
MSC. Issa Farhan

Introduction:-

- Organic chemistry is the branch of chemistry that deals with carbon and its compounds. It is fundamental to biology and medicine.
- Organic chemistry is the chemistry of carbon, an element that forms strong chemical bonds to other carbon atoms as well as to many other elements like hydrogen, oxygen, nitrogen, and the halogens.
- Organic chemicals were used in ancient times by Romans and Egyptians as dyes, medicines and poisons from natural sources, but the chemical composition of the substances was unknown .

Nomenclature

1- Find the longest carbon chain in the molecule. This will give you the base of the name:

<i>No of C atoms</i>	<i>Name</i>
1	meth- <i>ane</i>
2	eth- <i>ane</i>
3	prop- <i>ane</i>
4	but- <i>ane</i>
5	pent- <i>ane</i>
6	hex- <i>ane</i>
7	hept- <i>ane</i>
8	oct- <i>ane</i>
9	non- <i>ane</i>
10	dec- <i>ane</i>

2- Determine the principle functional group and its position.

<i>principal functional group</i>	<i>formula</i>	<i>ending becomes</i>
<i>alkane</i>	C-C	-ane
<i>alkene</i>	C=C	-ene
<i>alkyne</i>	C≡C	-yne
<i>alcohol</i>	-OH	-anol
<i>aldehyde</i>	-CH=O	-anal
<i>ketone</i>	>C=O	-anone
<i>carboxylic acid</i>	-COOH	-anoic acid

- ❖ Position is indicated, where necessary, by numbering the carbons in the main chain.
- ❖ Position need not be indicated for alkanes, as they have no functional group, and aldehydes and acids, as they are terminal functional groups.
- ❖ Positioning numbers are flanked by dash signs. Multiple positions for a given functional group are separated by commas and indicated by the prefixes di, tri, tetra, penta, hexa, hepta, octa , nona and deca.

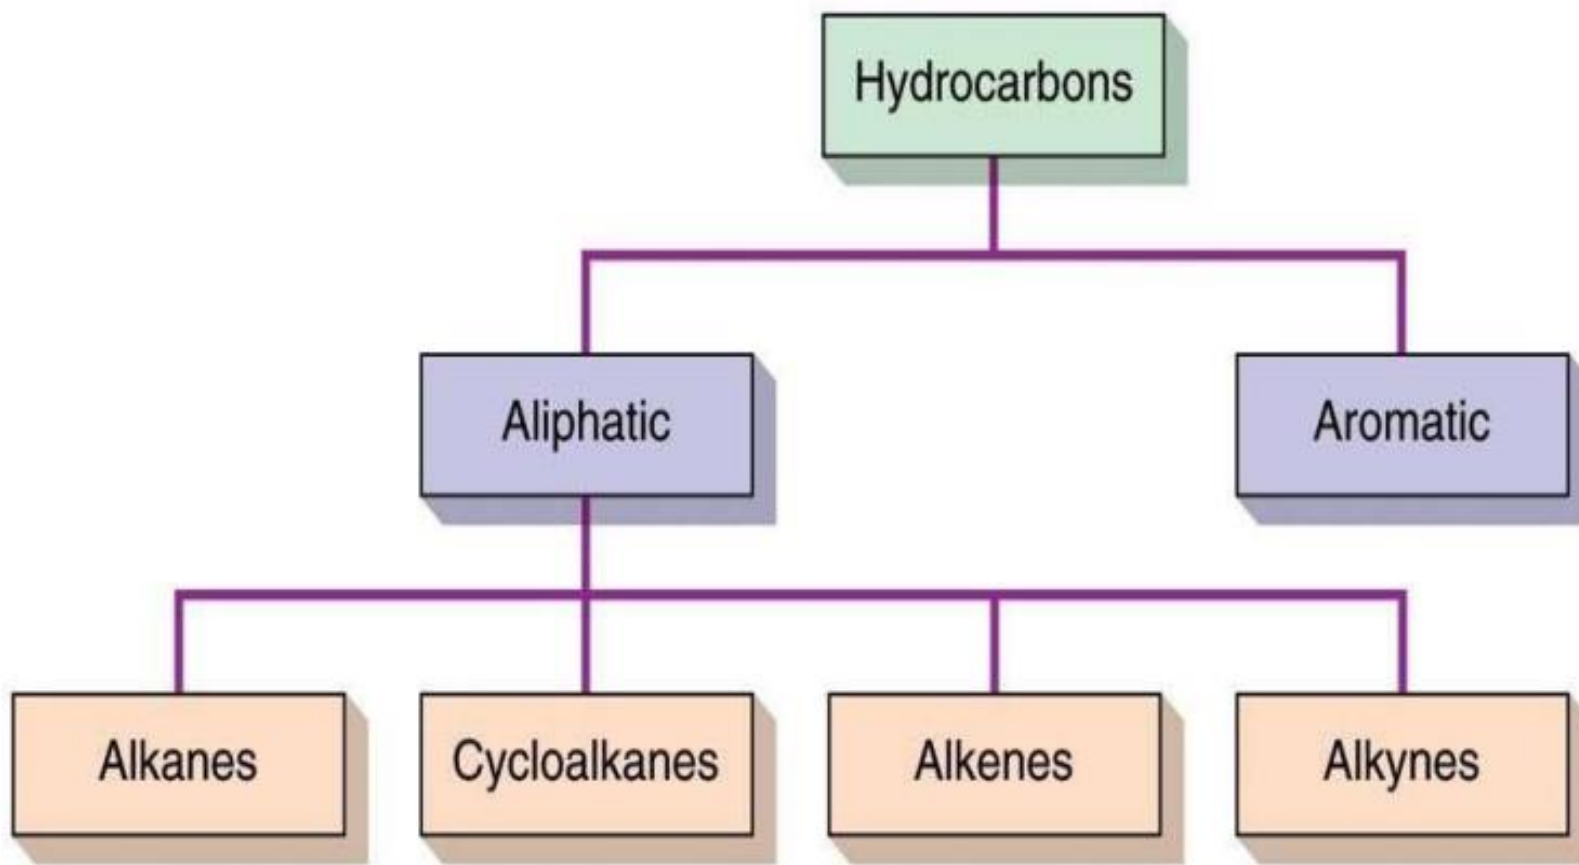

Ancillary functional groups are given in alphabetical order, with their position at the beginning of the name.

<i>ancillary functional group</i>	<i>formula</i>	<i>prefix</i>
<i>methyl</i>	$-\text{CH}_3$	<i>methyl</i>
<i>ethyl</i>	$-\text{C}_2\text{H}_5$	<i>ethyl</i>
<i>propyl</i>	$-\text{C}_3\text{H}_7$	<i>propyl</i>
<i>butyl</i>	$-\text{C}_4\text{H}_9$	<i>butyl</i>
<i>pentyl</i>	$-\text{C}_5\text{H}_{11}$	<i>pentyl</i>
<i>hexyl</i>	$-\text{C}_6\text{H}_{13}$	<i>hexyl</i>
<i>heptyl</i>	$-\text{C}_7\text{H}_{15}$	<i>heptyl</i>
<i>octyl</i>	$-\text{C}_8\text{H}_{17}$	<i>octyl</i>
<i>nonyl</i>	$-\text{C}_9\text{H}_{19}$	<i>nonyl</i>
<i>decyl</i>	$-\text{C}_{10}\text{H}_{21}$	<i>decyl</i>
<i>fluorine</i>	$-\text{F}$	<i>fluoro</i>
<i>chlorine</i>	$-\text{Cl}$	<i>chloro</i>
<i>bromine</i>	$-\text{Br}$	<i>bromo</i>
<i>iodine</i>	$-\text{I}$	<i>iodo</i>
<i>amine</i>	$-\text{NH}_2$	<i>amino</i>
<i>hydroxyl</i>	$-\text{OH}$	<i>hydroxy</i>
<i>cyanide</i>	$-\text{CN}$	<i>cyano</i>
<i>benzyl</i>	$-\text{CH}_2\text{C}_6\text{H}_5$	<i>benzyl</i>
<i>phenyl</i>	$-\text{C}_6\text{H}_5$	<i>phenyl</i>

Hydrocarbons

- Hydrocarbons are the most simple organic compounds.
- Hydrocarbons contain only carbon (C) and hydrogen (H.)
- Hydrocarbons can undergo reactions that release a large amount of energy.
- Hydrocarbons can be divided into aromatic and aliphatic hydrocarbons.
- The carbon atoms join together to form the framework of the compound, and the hydrogen atoms attach to them in many different configurations. chemical compound.

Classification of Hydrocarbon

Structures of Representative Hydrocarbons

aliphatic hydrocarbons

alkane

alkene

alkyne

aromatic hydrocarbons

Functional Groups:-

1. Functional groups are the components of organic molecules that are most commonly involved in chemical reactions.
2. The number and arrangement of functional groups give each molecule its unique properties.

Functional Group Name	Suffix Ending	Functional Group Structure
Alkane	-ane	C-H atoms
Alcohol	-ol	--OH
Alkene	-ene	C=C
Alkyne	-yne	HC≡CH
Aldehyde	-al	$\begin{array}{c} \text{O} \\ \parallel \\ \text{---C---H} \end{array}$
Amine	-amine	--N--
Ether	-ether	--O--
Ester	-oate	$\begin{array}{c} \text{O} \\ \parallel \\ \text{---C---O---} \end{array}$
Ketone	-one	$\begin{array}{c} \text{O} \\ \parallel \\ \text{---C---} \end{array}$
Nitrile	-ile	---C≡N

Hydrocarbon Derivatives

alkane

alkene

alkyne

phenyl

alkyl halide
(X = F, Cl, Br, I)

amine

alcohol

ether

aldehyde

ketone

carboxylic
acid

ester

amide

Hydroxyl

STRUCTURE

(may be written
HO—)

Alcohols
(Their specific
names usually
end in *-ol.*)

NAME OF
COMPOUND

EXAMPLE

Ethanol

- Is polar as a result of the electrons spending more time near the electronegative oxygen atom.
- Can form hydrogen bonds with water molecules, helping dissolve organic compounds such as sugars.

FUNCTIONAL
PROPERTIES

Methyl

STRUCTURE

Methylated compounds

NAME OF COMPOUND

EXAMPLE

5-Methyl cytidine

- ## FUNCTIONAL PROPERTIES
- Addition of a methyl group to DNA, or to molecules bound to DNA, affects the expression of genes.
 - Arrangement of methyl groups in male and female sex hormones affects their shape and function.

Carbonyl

STRUCTURE

Ketones if the carbonyl group is within a carbon skeleton

Aldehydes if the carbonyl group is at the end of the carbon skeleton

NAME OF COMPOUND

EXAMPLE

Acetone

- A ketone and an aldehyde may be structural isomers with different properties, as is the case for acetone and propanal.
- Ketone and aldehyde groups are also found in sugars, giving rise to two major groups of sugars: ketoses (containing ketone groups) and aldoses (containing aldehyde

FUNCTIONAL PROPERTIES

Amino

STRUCTURE

Amines

NAME OF COMPOUND

EXAMPLE

Glycine

FUNCTIONAL PROPERTIES

- Acts as a base; can pick up an H^+ from the surrounding solution (water, in living organisms):

- Found in cells in the ionized form with a charge of 1+.

Carboxyl

STRUCTURE

Carboxylic acids, or organic acids

NAME OF COMPOUND

EXAMPLE

Acetic acid

- Acts as an acid; can donate an H^+ because the covalent bond between oxygen and hydrogen is so polar:

Nonionized

Ionized

FUNCTIONAL PROPERTIES

- Found in cells in the ionized form with a charge of 1^- and called a carboxylate ion.

Phosphate

STRUCTURE

Organic phosphates

NAME OF
COMPOUND

EXAMPLE

Glycerol phosphate

FUNCTIONAL
PROPERTIES

- **Contributes negative charge to the molecule of which it is a part (2- when at the end of a molecule, as at left; 1- when located internally in a chain of phosphates).**
- **Molecules containing phosphate groups have the potential to react with water, releasing energy.**

Thank

you
