Dropping Tables and Databases, and Updating Data

Dropping Tables:

Dropping a table means permanently removing it from the database schema along with all its data and associated objects. This operation should be performed with caution as it cannot be undone. Here's the syntax to drop a table:

```
DROP TABLE table_name;
```

Dropping Databases:

Dropping a database removes the entire database and all its contents, including tables, views, stored procedures, and data. This operation is irreversible and should be used with extreme caution. Here's the syntax to drop a database:

```
DROP DATABASE database_name;
```

Updating Data:

Updating data involves modifying existing records in the database tables. It allows you to change the values of one or more columns based on specified conditions. Here's an example for updating data in a table:

```
UPDATE table_name

SET column_name = value

WHERE another_column_name = value;
```
