# Operating Systems Chapter 2: Operating-System Services

Lecturer: Dalya Samer

**Operating System Concepts – 10th Edition** 

# **Chapter2 Outlines**

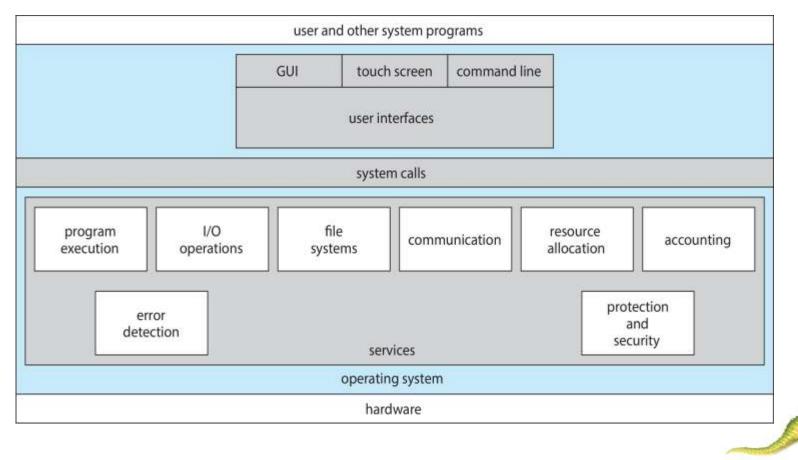

- Operating System Services
- User Operating System Interface
- System Calls
- Types of System Calls
- System Programs
- Operating System Design and Implementation
- Operating System Structure

### **Operating System Services**

 Operating systems provide an environment for execution of programs and services to programs and users

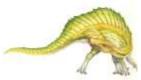

# **Operating System Services (Cont.)**

- One set of operating-system services provides functions that are helpful to the user:
  - User interface Almost all operating systems have a user interface (UI).
    - Varies between Command-Line (CLI), Graphics User
       Interface (GUI), touch-screen, Batch
  - Program execution The system must be able to load a program into memory and to run that program, end execution, either normally or abnormally (indicating error)
  - I/O operations A running program may require I/O, which may involve a file or an I/O device.

- One set of operating-system services provides functions that are helpful to the user (Cont.):
- File-system manipulation The file system is of particular interest.
  Programs need to read and write files and directories, create and delete them, search them, list file Information, permission management
- Communications Processes may exchange information, on the same computer or between computers over a network.
  - Communications may be via shared memory or through message passing (packets moved by the OS)

- One set of operating-system services provides functions that are helpful to the user (Cont.):
  - Error detection OS needs to be constantly aware of possible errors.
    - May occur in the CPU and memory hardware, in I/O devices, in user program.
    - For each type of error, OS should take the appropriate action to ensure correct and consistent computing.
    - Debugging facilities can greatly enhance the user's and programmer's abilities to efficiently use the system.

- Another set of OS functions exists for ensuring the efficient operation of the system itself via resource sharing:
  - Resource allocation When multiple users or multiple jobs running concurrently, resources must be allocated to each of them.
    - Many types of resources CPU cycles, main memory, file storage, I/O devices.
  - Accounting To keep track of which users use how much and what kinds of computer resources.

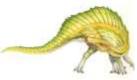

- Another set of OS functions exists for ensuring the efficient operation of the system itself via resource sharing: (Cont.)
  - Protection and security The owners of information stored in a multiuser or networked computer system may want to control use of that information, concurrent processes should not interfere with each other.
    - **Protection** involves ensuring that all access to system resources is controlled.
    - Security of the system from outsiders requires user authentication, extends to defending external I/O devices from invalid access attempts.

**Operating System Concepts – 10th Edition** 

### **A View of Operating System Services**

		user and other	system pro	grams		
		GUI toud	ch screen	command li	ne	
		user i	nterfaces			
		syst	em calls			
program execution	I/O operations	file systems	comm	unication	resource allocation	accounting
	ror ction	se	rvices		a	ection Ind Turity
		operat	ing system	1		
		ha	rdware			

- **CLI** or **command interpreter** allows direct command entry.
- Sometimes implemented in kernel, sometimes by systems program
- Sometimes multiple flavors implemented shells
- Primarily fetches a command from user and executes it
- Sometimes commands built-in, sometimes just names of programs.

# **User Operating System Interface(2/5)**

### **Bourne Shell Command Interpreter**

**Operating System Concepts – 10th Edition** 

# **User Operating System Interface(3/5)**

- Graphics User Interface (GUI)
- User-friendly desktop metaphor interface
  - Usually mouse, keyboard, and monitor
  - **Icons** represent files, programs, actions, etc
  - Various mouse buttons over objects in the interface cause various actions (provide information, options, execute function, open directory (known as a **folder**)
  - Invented at Xerox PARC
- Many systems now include both CLI and GUI interfaces

# **User Operating System Interface(4/5)**

- Touchscreen Interfaces
- Touchscreen devices require new interfaces.
  - Mouse not possible or not desired.
  - Actions and selection based on gestures.
  - Virtual keyboard for text entry.
- Voice commands.

- Programming interface to the **services provided** by the **OS**.
- Typically written in a high-level language (C or C++)
- Mostly accessed by programs via a high-level Application
   Programming Interface (API) rather than direct system call use.
- Three most common APIs are Win32 API for Windows, POSIX API for POSIX-based systems (including virtually all versions of UNIX, Linux, and Mac OS X), and Java API for the Java virtual machine (JVM).

• **Example:** System call sequence to copy the contents of one file to another file

### **System Calls**

#### EXAMPLE OF STANDARD API

As an example of a standard API, consider the read() function that is available in UNIX and Linux systems. The API for this function is obtained from the man page by invoking the command

man read

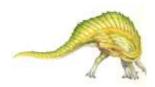

on the command line. A description of this API appears below:

#include	<unistd.h></unistd.h>					
ssize_t	read(int	fd,	voiđ	*buf,	size_t	count)
return value	function name		p	aramete	ers	

A program that uses the read() function must include the unistd.h header file, as this file defines the ssize\_t and size\_t data types (among other things). The parameters passed to read() are as follows:

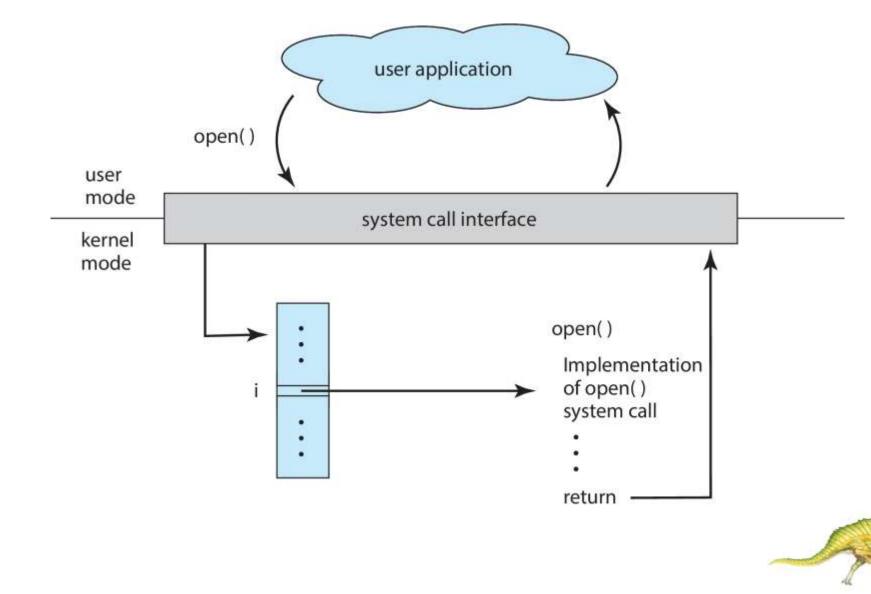

- int fd—the file descriptor to be read
- void \*buf —a buffer into which the data will be read
- size\_t count—the maximum number of bytes to be read into the buffer

On a successful read, the number of bytes read is returned. A return value of 0 indicates end of file. If an error occurs, read() returns -1.

#### **Operating System Concepts – 10<sup>th</sup> Edition**

# **API – System Call – OS Relationship**

**Operating System Concepts – 10th Edition** 

### **Examples of Windows and Unix System** Calls

#### EXAMPLES OF WINDOWS AND UNIX SYSTEM CALLS

The following illustrates various equivalent system calls for Windows and UNIX operating systems.

	Windows	Unix
Process	CreateProcess()	fork()
control	ExitProcess()	exit()
	WaitForSingleObject()	wait()
File	CreateFile()	open()
management	ReadFile()	read()
	WriteFile()	write()
	CloseHandle()	close()
Device	SetConsoleMode()	ioctl()
management	ReadConsole()	read()
	WriteConsole()	write()
Information	GetCurrentProcessID()	getpid()
maintenance	SetTimer()	alarm()
	Sleep()	<pre>sleep()</pre>
Communications	CreatePipe()	pipe()
	CreateFileMapping()	shm_open()
	MapViewOfFile()	mmap()
Protection	SetFileSecurity()	chmod()
	InitlializeSecurityDescriptor()	umask()
	SetSecurityDescriptorGroup()	chown()

#### **Operating System Concepts – 10th Edition**

C program invoking printf() library call, which calls write() system call

#### **Operating System Concepts – 10th Edition**

### **Types of System Calls**

### Process control

- create process, terminate process
- end, abort
- load, execute
- get process attributes, set process attributes
- wait for time
- wait event, signal event
- allocate and free memory
- Dump memory if error
- **Debugger** for determining **bugs**, **single step** execution
- Locks for managing access to shared data between processes

# **Types of System Calls (Cont.)**

- File management
  - create file, delete file
  - open, close file
  - read, write, reposition
  - get and set file attributes
- Device management
  - request device, release device
  - read, write, reposition
  - get device attributes, set device attributes
  - logically attach or detach devices

- Information maintenance
  - get time or date, set time or date
  - get system data, set system data
  - get and set process, file, or device attributes

### Communications

- create, delete communication connection
- send, receive messages if message passing model to host name or process name
  - From client to server
- Shared-memory model create and gain access to memory regions
- transfer status information
- attach and detach remote devices

### **Types of System Calls (Cont.)**

### Protection

- Control access to resources
- Get and set permissions
- Allow and deny user access

- System programs provide a convenient environment for program development and execution.
- They can be divided into:
  - File manipulation
  - Status information sometimes stored in a file
  - Programming language support
  - Program loading and execution
  - Communications
  - Background services
  - Application programs

- File management Create, delete, copy, rename, print, dump, list, and generally manipulate files and directories/
- Status information
  - Some ask the system for info date, time, amount of available memory, disk space, number of users
  - Others provide detailed performance, logging, and debugging information
  - Typically, these programs format and print the output to the terminal or other output devices.

### File modification

- > Text editors to create and modify files
- Special commands to search contents of files or perform transformations of the text
- Programming-language support Compilers, assemblers, debuggers and interpreters sometimes provided.
- Communications Provide the mechanism for creating virtual connections among processes, users, and computer systems.
  - Allow users to send messages to one another's screens, browse web pages, send electronic-mail messages, log in remotely, transfer files from one machine to another

- Background Services
  - Launch at boot time
    - Some for system startup, then terminate
    - Some from system boot to shutdown
  - Provide facilities like disk checking, process scheduling, error logging, printing

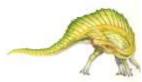

### Application programs

- Don't pertain to system
- Run by users
- Not typically considered part of OS

- Design and Implementation of OS is not "solvable", but some approaches have proven successful.
- Internal structure of different Operating Systems can vary widely
- Start the design by **defining goals** and specifications
- Affected by choice of hardware, type of system.
- User goals and System goals:
  - <u>User goals</u> operating system should be convenient to use, easy to learn, reliable, safe, and fast
  - <u>System goals</u> operating system should be easy to design, implement, and maintain, as well as flexible, reliable, error-free, and efficient
- Specifying and designing an OS is highly creative task of software engineering

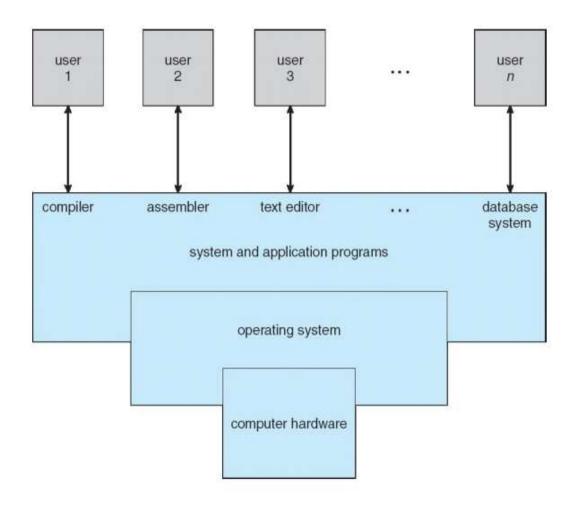

### **OS Design and Implementation**

- Much variation
  - Early OSes in assembly language
  - Then system programming languages like Algol, PL/1
  - Now C, C++
- Actually usually a mix of languages
  - Lowest levels in assembly
  - Main body in C
  - Systems programs in C, C++, scripting languages like PERL, Python, shell scripts

## **Operating System Structure**

**Operating System Concepts – 10th Edition** 

### **Operating System Structure**

- General-purpose OS is very large program
- Various ways to structure ones
  - Simple structure MS-DOS
  - More complex UNIX
  - Layered an abstraction
  - Microkernel Mach
