## Numerical Integration

Consider the function: $f(x)=1.5+\sin (x)$. The curve of this function is:

The integration of this equation over the indicated period is the area under the curve:

$$
I=\int_{a}^{b} f(x) d x
$$

If we sample the function into equally spaced points, we can approximate this integration through several numerical methods, below are the selected ones for this course:

| $x_{i}$ | $f\left(x_{i}\right)$ |
| :--- | :--- |
| 0 | 1.5 |
| 0.8976 | 2.2818 |
| 1.7952 | 2.4749 |
| 2.6928 | 1.9339 |
| 3.5904 | 1.0661 |
| 4.4880 | 0.5251 |
| 5.3856 | 0.7182 |
| 6.2832 | 1.5 |

## Rectangular Rule

The simplest way is to add up the values of these samples. This means we divide the area into $n$ rectangles and sum up their areas to compute the overall value. The simplicity of this method comes at the price of errors. However, as $n$ becomes larger the error decreases.

With: $\quad h=\frac{b-a}{n} \quad$ The area is $\quad I=h \sum_{i=0}^{n-1} f\left(x_{i}\right)$

Example1: Calculate the following integral using rectangular rule. Use $n=6$.

$$
\int_{0}^{1.2} \cos x d x
$$

Solution: here we have $f(x)=\cos (x)$, and $h=\frac{1.2-0}{6}=0.2$

| $i$ | $x_{i}$ | $f\left(x_{i}\right)$ |
| :--- | :--- | :--- |
| 0 | 0 | 1 |
| 1 | 0.2 | 0.9801 |
| 2 | 0.4 | 0.9211 |
| 3 | 0.6 | 0.8253 |
| 4 | 0.8 | 0.6967 |
| 5 | 1 | 0.5403 |
| 6 | 1.2 | 0.3624 |

$$
I=h \sum f\left(x_{i}\right)=0.2(1+0.9801+\cdots+0.5403)=0.9927
$$

Example2: repeat Example1 with $n=8,11,15$.
Answer: $I_{8}=0.9781 . I_{11}=0.9659, I_{15}=0.9570$. For very large $n$, we get $I \approx$ the exact value which is 0.932 .

Example3: Calculate the following integral using rectangular rule. Use $n=8$.

$$
\int_{-2}^{3}\{0.5+\sin (x)\} d x
$$

Solution: here we have $f(x)=0.5+\sin (x)$, and $h=0.625$.

| $i$ | $x_{i}$ | $f\left(x_{i}\right)$ |
| :--- | :--- | ---: |
| 0 | -2 | -0.4093 |
| 1 | -1.375 | -0.4809 |
| 2 | -0.75 | -0.1816 |
| 3 | -0.125 | 0.3753 |
| 4 | 0.5 | 0.9794 |
| 5 | 1.125 | 1.4023 |
| 6 | 1.75 | 1.4840 |
| 7 | 2.375 | 1.1937 |
| 8 | 3 | 0.6411 |

$I=0.625 \sum f\left(x_{i}\right)=2.7268$
$i=0$
Example4: Calculate the following integral using rectangular rule. Use $n=6$.

$$
\int_{-1}^{3} \frac{e^{-x^{2}}}{\sqrt{2 \pi}} d x
$$

Solution: here we can build the table using only:

$$
\int_{-1}^{3} e^{-x^{2}} d x
$$

And then divide the result by $\sqrt{2 \pi}$. So, $f(x)=e^{-x^{2}}$, and $h=0.6667$.

| $i$ | $x_{i}$ | $f_{i}$ |
| :--- | :--- | :--- |
| 0 | -1 | 0.3679 |
| 1 | -0.3333 | 0.8948 |
| 2 | 0.3333 | 0.8948 |
| 3 | 1 | 0.3679 |
| 4 | 1.6667 | 0.0622 |
| 5 | 2.3333 | 0.0043 |
| 6 | 3 | 0.0001 |

$I=\frac{0.6667}{\sqrt{2 \pi}} \sum_{i=0}^{5} \boldsymbol{J}^{i}-\mathbf{v . 0 0 フ 4}$
We can write $f\left(x_{i}\right)$ as $f_{i}$ for simplicity.

## The Trapezoidal Rule

Instead of a simple rectangle, the slice here is a Trapezoid. This provides a closer approximation to the actual function.

With: $\quad h=\frac{b-a}{n} \quad$ The area is $\left.\quad I=\frac{h}{2} f_{0}+f\right\}+h \sum_{i=1}^{n-1} f_{i}$

Example5: repeat Example1 using Trapezoidal rule.
Solution: for the same table, we get
$I=\frac{0.2}{2}(1+0.3624)+0.2(0.9801+\cdots+0.5403)=0.9289$
Which is closer to the actual value 0.9320 at the same $n$. Even for larger $n, I_{8}=0.9303 . I_{11}=$ $0.9312, I_{15}=0.9315$.

## Simpson's 1/3 Rule

This method obtains a more accurate estimate of an integral by using higher-order polynomials to connect the points.

With: $\quad h=\frac{b-a}{n} \quad$ where $n$ is even $\quad I=\frac{h}{3}\left[f_{0}+f_{n}+4 \sum_{i=1,3,5}^{n-1} f_{i}+2 \sum_{i=2,4,6}^{n-2} f_{i}\right]$

Example6: repeat Example1 using Simpson's 1/3 Rule.

## Solution:

$$
I=\frac{0.2}{3}[1+0.3624+4(0.9801+0.8253+0.5403)+2(0.9211+0.6967)]=0.9321
$$

The table below shows the comparison between the actual value from the studied rules:

|  | Computed | $\varepsilon$ Et $\%$ |
| :--- | ---: | :--- |
| Actual Value | 0.9320 |  |
| Simpson's 1/3 Rule | 0.9321 | 0.011 |
| The Trapezoidal Rule | 0.9289 | 0.333 |
| Rectangular Rule | 0.9927 | 6.513 |
