Mathematics II

Revision:

1. Vectors analysis including parametric equations for lines in space

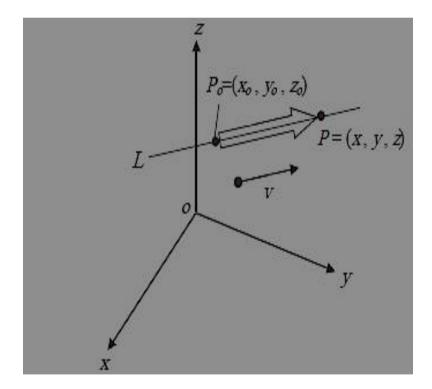

2. Vectors analysis including parametric equations for planes in space.

- 3. Vectors analysis/angle between two planes.
- 4. Vectors analysis/intersection line &plane.
- **5. Vector Functions**
- 6. Integral of vector function and distance along the curve.
- 7. Unit tangent and normal vector for curve.
- 8. Curvature, Torsion & binormal vector
- 9. Polar Coordinates
- 10. Function of two or more variables
- 11. Partial derivative
- 12. Directional derivative
- 13. Tangent planes and normal lines
- 14. The extremes (max,min &saddle points)

<u>1. Vectors analysis including parametric equations</u></u> <u>for lines in space:-</u>

Equation lines in space:

Suppose that L is a line in space through a point $P_o (x_o, y_o, z_o)$ Parallel to a vector v = ai + bj + ck, then L is the set of all points p (x, y, z) for which P_oP is parallel to v. thus $P_oP = tv$ for some scalar parameter t. the value of t depend on the location of the point P along the line. the expanded from of the equation:

$$\overline{P_oP} = tv$$

$$(x - x_o)i + (y - y_o)j + (z - z_o)k = t(ai + bj + ck)$$

$$x - x_o = ta$$

$$y - y_o = tb$$

$$z - z_o = tc$$

From equation above:

The parametric equation for the line through $P_o(x_o, y_o, z_o)$ parallel to v = ai + bj + ck:

$x = x_o + ta$
$y = y_o + tb$
$z = z_o + tc$

Example: find parametric equation for the line through the points P(-3,2,-3) and Q(1,-1,4)

Solution: the vector $\overrightarrow{PQ} = (1 - (-3))i + (-1 - 2)j + (4 - (-3))k$ $\overrightarrow{PQ} = 4i - 3j + 7k$ $\therefore \quad a = 4 \quad , \quad b = -3 \quad , \ c = 7$ Al-mustaqbal University Collage

Mathematics(II) A
Dr. *Alaa Mohammed Hussein Wais*

$$\therefore \quad x_o = -3 \quad , \quad y_o = 2 \quad , \quad z_o = -3$$

$$\therefore \quad x = x_o + at \quad \longrightarrow \qquad x = -3 + 4t$$

$$y = y_o + bt \quad \longrightarrow \qquad y = 2 - 3t$$

$$z = z_o + ct \quad \implies \qquad z = -3 + 7t$$

Example: Find parametric equations for the line through the point (-2,0,4)parallel to the vector v = 2i + 4j - 2k

Solution:

With
$$P_o(x_o, y_o, z_o) = (-2, 0, 4)$$

 $x_o = -2$, $y_o = 0$, $z_o = 4$
and $v = ai + bj + ck = 2i + 4j - 2k$
 $a = 2$, $b = 4$, $c = -2$

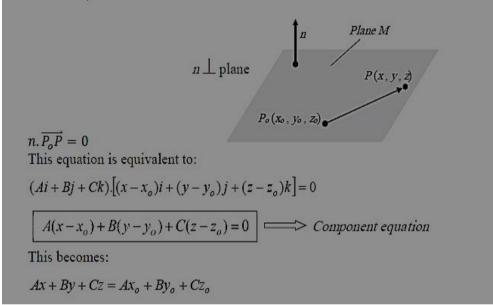

10

 $x = x_o + at \implies x = -2 + 2t$ $y = y_o + bt \implies y = 4t$ $z = z_o + ct \implies z = 4 - 2t$

2.Vectors analysis including parametric equations for planes in space :-

Equation for plane in space:

Suppose that plane *M* passes through a point $P_o(x_o, y_o, z_o)$ and is normal to the nonzero vector n = Ai + Bj + Ck, then *M* is the set of all points P(x,y,z) for which $\overrightarrow{P_oP}$ is orthogonal to *n*. Thus the dot product

$$Ax + By + Cz = D \implies Component equation simplified$$

Where $D = Ax_o + By_o + Cz_o$

Mathematics(II) Al-mustaqbal University Collage Dr. *Alaa Mohammed Hussein Wais*

Example: Find an equation for the plane through *Po* (4,2,1) normal to $\overline{N = 5\iota + 2J - 3k}$.

Solution//

 $D=AX_0+BY_0+CZ_0=5*4+2*2-3*1=21$

Ax+By+Cz=D

5x+2y-3z=21

Example: Find an equation for the plane through A(1,1,1), B(3,2,4) and C(3,0,3).

Solution//

$$=(3-1)i+(2-1)j+(4-1)k=2i+j+3k\overline{AB}$$

$$=(3-1)i+(0-1)j+(3-1)k=2i-j+2k\overline{AC}$$

$$\overline{AB} X \overline{AC} = \begin{vmatrix} i & j & k \\ 2 & 1 & 3 \\ 2 & -1 & 2 \end{vmatrix} \\= [2 - (-3)i - (4 - 6)j + (-2 - 2)k] \\= 5i + 2j - 4k]$$

 $D=Ax_0+By_0+Cz_0=5*1+2*1-4*1=3$

5x+2y-4z=3
